

VIDEO CALL ROUTING WITH PRESENCE DETERMINATION

ABSTRACT OF THE DISCLOSURE

A request to establish video communication with a recipient associated with
5 multiple communication devices is received. The recipient is identified using
information contained within the request. A set of communication devices
associated with the recipient is determined. A first communication device with a
highest probability of being accessible to the recipient is selected from the set. The
video communication request is forwarded to the first selected communication
10 device.
